## Emacs Distributions

Emacs Distributions = Emacs base files + modes + install routines + goodies

- XEmacs: historical
- GNU/Emacs: this is where the music plays
  - GNU/Linux
    - \* easy (see next section)
  - macOS
    - \* GNU/Emacs for OS X
    - \* Aquamacs (historical)
  - Microsoft Windows
    - \* GNU/Emacs

## Installing Emacs

Download GNU/Emacs (general URL)

- Windows
  - download latest ZIP from a mirror
    - \* e.g., `emacs-25.2-x86_64.zip`
  - unpack ZIP file
  - start installation exe
  - create start icon
- GNU/Linux
  - ask your local package management
    - \* e.g., `apt install emacs`
- macOS
  - 3 options
    - \* `brew install emacs --with-cocoa`
    - \* `sudo port install emacs-app`
    - \* Emacs for OSX

## Starting Emacs

- `emacs`
- run as server + `emacsclient`
  - `(server-start)`
- plain GNU/Emacs: `emacs -q` or `emacs --no-init-file`
- debugging startup issues: `emacs --debug-init`

## UI Elements

### UI Elements Overview

- Menu Bar
- Windows != Buffers
- Mode Line(s)
- Mini Buffer

## Commands

- Icons
- Menus
- Shortcuts
- M-x → type in commands in Mini Buffer

Abbrev	Key
<b>C</b>	<b>Ctrl</b>
<b>M</b>	<b>Alt</b> or <b>ESC</b>
<b>S</b>	<b>Shift</b>
<b>C-M-t</b>	press <b>t</b> while holding <b>Ctrl</b> and <b>Alt</b>

## Help

- C-h ? help of help
- C-h v help variable
- C-h f help function

Example: sort-lines → C-h f = help for this function

M-x help-with-tutorial (C-h t)

Basic movement and text manipulation. Just do it!

## Cheatsheets

- GNU Emacs Reference Card
- Sacha Chua:
  - How to Learn Emacs
  - How to learn Emacs keyboard shortcuts
  - Map for learning Org Mode
  - Use Dired to manage files; Emacs movements
- Org-Mode Reference Card

## Modes

Many modes are built-in so that you can run them out-of-the-box:

- Org-mode
- mail-mode
- ...

Thousands of modes can be installed on-top for your Emacs.

Some modes are loaded according to file extensions: `FOOBAR.org` → Org-mode

## Geting Even More

- elisp-files
  - GitHub
  - web pages
  - simple snippets
- Package manager
  - configure package repositories
    - \* ELPA
    - \* MELPA
    - \* Marmalade

- M-x list-packages

## init.el

System startup file: `/etc/emacs/site-start.el`

Each user has its startup file that holds personalizations:

- `$HOME/.emacs` or `$HOME/.emacs.d/init.el`
  - On Windows, it's more complicated
- My startup files (for getting ideas)
  - `(load "~/emacs.d/main.el")` loads my `main.el`
  - best used within Emacs:
    - \* C-u TAB on the first asterisk → fold headings starting with ; ;\*
    - \* TAB fold/unfold a single heading

## use-package

Installing packages within your `init.el`: `use-package`

Installing via M-x `list-packages` (and mouse):

- installs only on current host
- more detailed configuration has to be written in `init.el` in any case

Advantage of `use-package`: installs most current version of a package on each host that uses same (shared) `init.el`.

One-time setup in `init.el` to be able to use `use-package`:

From [cachestocaches.com](http://cachestocaches.com):

```
(require 'package)
(setq package-enable-at-startup nil)
(add-to-list 'package-archives '("melpa" . "http://melpa.org/packages/"))
(add-to-list 'package-archives '("marmalade" . "http://marmalade-repo.org/packages/"))
(add-to-list 'package-archives '("gnu" . "http://elpa.gnu.org/packages/"))
(package-initialize)

(unless (package-installed-p 'use-package)
  (package-refresh-contents))
```

```

(package-install 'use-package))

(eval-when-compile
  (require 'use-package))
(require 'diminish)
(require 'bind-key)

```

Examples of installing packages via use-package:

```

;; Nyan cat as a horizontal scroll bar
(use-package nyan-mode
  :ensure t ;; install package if not found OR: (setq use-package-always-ensure t)
  :config ;; executed after loading package
  (nyan-mode t)
)

```

```

;; http://www.emacswiki.org/emacs/UndoTree
(use-package undo-tree
  :ensure t
  :diminish undo-tree-mode
  :config ;; executed after loading package
  (autoload 'undo-tree "undo-tree.el")
)

```

```

;;** yafolding
;; https://github.com/zenozeng/yafolding.el
;; Folding based on indentation
(use-package yafolding
  :ensure t
  :defer 10
  :mode ("\\.xml\\'" . yafolding-mode)
  :config ;; executed after loading package
  (add-to-list 'auto-mode-alist '("\\.xml$" . nxml-mode))
  :bind ((("<M-S-return>" . yafolding-toggle-all)
         ("<M-return>" . yafolding-toggle-element)
         ("<C-Tab>" . yafolding-toggle-element))
)

```
